

Example Error and Warning messages when using ExifTool:

Error: Not a valid JPEG (looks more like a PNG) – Adam_McKay.jpg

Warning: [minor] Ignored APP1 XMP segment with non-standard header – Zach_Cregger.jpg

Error: JPEG EOI marker not found – Alicia_Leigh_Willis.jpg

Error: Not a valid JPEG (looks more like a GIF) – chad_cleven.jpg

Warning: Multiple Photoshop records – Danny_Kaye.jpg

Error: Corrupted JPEG image – Joe_Pingue.jpg

Need Image Sorting Script - XMP & ExifTool

Most images have XMP metadata that contains the “face box” coordinates of all faces in that image. The script needs to move files that don't have any face coordinates to another folder. If the script detects any files with errors or warnings, those files should also be moved to another folder.

Example: The folder name is "Volunteer Images" and contains 18,000 JPG files. The script should create a subfolder called "XMP-Volunteer Images" and move those files without XMP face data into this folder. It should create another subfolder called “ER-Volunteer Images” and put images with warnings or errors in this folder.

This is what the XMP data looks like on those with face coordinates. Includes categories:

XMP-x

XMP-AnVoltFaceInfo

XMP-AnVoltPicasa

XMP-MP
